

## Computation exercise 4(a): Dynamic Error Budgeting

Mechatronic systems  
376.050  
2016W

Important: Answers must be a hard copy and submitted to the office in CA0421 by January 11, 2017 at 4pm. The work must be original. For questions about this exercise, please contact Mr. Thier (thier@acin.tuwien.ac.at).

Fig. 1 shows a lumped mass model of a positioning system actuated by a flexure-guided Lorentz actuator on a vibrating floor. The position  $x_m$  of the moving mass  $m$  is measured by a position sensor to regulate by feedback control  $C(s)$  rejecting the floor vibrations. Fig. 2 shows the control block diagram, where  $P_a(s)$  and  $P_t(s)$  are the plant with position reference  $r$ , position error  $e$ , sensor noise  $n$ , floor motion in velocity  $v_f = \dot{x}_f$  and actuation force  $F$ . The mechanical parameters are given in Table 1 together with the spectral density of  $n$  and  $\dot{x}_f$ . By assuming that these spectral densities uniformly exist only between 1 Hz and 1 kHz, answer the questions with the following feedback controller

$$C(s) = 3m\omega_c^2 \frac{(s + 0.1\omega_c)(s + \omega_c/3)}{s(s + 3\omega_c)}.$$

Fig. 1: Lumped mass model.

Fig. 2: Block diagram

Table 1: Parameters

Param.	Description
$m$	2 g
$c$	0.02 N/(m/s)
$k$	20 N/m
$n$	1 nm/ $\sqrt{\text{Hz}}$
$v_f$	2 ( $\mu\text{m/s}$ )/ $\sqrt{\text{Hz}}$
$\omega_c$	$2\pi \times 100$ rad/s

- Derive a transfer function from  $n$  to  $x_m$  and a transfer function from  $v_f$  to  $x_m$ , respectively. [10%]
- Draw Bode plots of the transfer functions in (i). [5 %]
- Calculate the power spectral density of  $x_m$  by considering the sensor noise  $n$ , and plot it as a function of frequency. [15 %]
- Calculate the positioning resolution of the system (i.e. standard deviation of  $x_m$ ) resulting from the sensor noise  $n$ . [15 %]
- Calculate the positioning resolution resulting from the floor vibrations  $v_f$ . [20 %]
- Calculate the overall positioning resolution by considering both the sensor noise and the floor vibrations. [15 %]
- Simulate the overall positioning resolution for a case that the control bandwidth ( $\omega_c$ ) is decreased by half. Using the results, discuss the influence of the sensor noise and the floor vibrations on the achievable positioning resolution individually. [20 %]
